

A great place to start your research! You can quickly discover relevant information on any topic from across the library's collections.

SEARCH >

Searching is like searching the open Web, so start with a few keywords. If you are searching for a known item, you might want to try the Advanced Search option.

Enter search terms in the single search box, or select the down-arrow to the right of the search button to use the Advanced Search form to create a more specific query using fielded search options and Boolean operators.

NAVIGATE RESULTS >

Once you have a set of results, there are many options to help you explore topics, narrow your results set, and refine your search query. Recommendations and suggestions for other resources or search terms are also provided.

Sort results by relevance or date.

Your query may automatically be expanded to include additional keywords and spelling variations. If precision searching is desired, click the link to just search the search terms entered.

Refine using facets and filters to narrow or expand results. Options include discipline, date, content type, subject, and more. Facets may change and get more granular as you navigate your search results.

Based on your search query terms, the Topic Explorer pane may appear on the right providing relevant topical reference content and suggestions for librarians to contact, recommendations for research guides to explore, and more.

Text mining
From Wikipedia, the free encyclopedia

Text mining, sometimes alternately referred to as "text data mining", roughly equivalent to text analytics, refers to the process of deriving high-quality information from text. High-quality information is typically derived through the devising of patterns and trends through means such as statistical pattern learning. Text mining usually involves the process of structuring the input text (usually parsing, along with the addition of some derived linguistic features and the removal of others, and subsequent insertion into a database), deriving patterns within the structured data, and finally evaluation and interpretation of the output. "High quality" in text mining usually refers to some combination of relevance, novelty, and interestingness. Typical text mining tasks include text categorization, text clustering, concept/entity extraction, production of granular taxonomies, sentiment analysis, document summarization, and entity relation modeling ("i.e.", learning relations between named entities).
